

Project Design Phase-II

Customer Journey Map

Automated Network Request Management | Team ID: Servicenow | Date: 06/09/2026

Scenario: An employee raises, tracks, and receives fulfilment of a network service request

	Realize Need <i>How does the need for a network service arise?</i>	Submit Request <i>How does the requester raise the request?</i>	Approval & Processing	Fulfilment <i>What happens as the request is completed?</i>	Closure & Feedback
Steps <i>What does the requester experience?</i>	Employee identifies a need for a new or existing network connection at their workstation or site.	Logs into the Service Portal and opens the Network Request catalog item; fills in connection type, address, and payment details.	Flow Designer creates the request record and routes it to the manager for approval; approver reviews and approves or rejects.	On approval, the IT / Network Fulfilment Team implements the connection or change based on the request record.	Requester receives final status by email; request is marked closed and available for review.
Interactions <i>Touchpoints & people involved</i>	- Colleagues - IT helpdesk (informally)	- Service Portal - Network Request catalog item - Request Information variable set	- Flow Designer - Native Approval engine - Manager / Approver	- Database Tables record - IT / Network Fulfilment Team	- Email notification - Closed request record
Goals & Motivations <i>"Help me..."</i>	Help me know where to raise this request	Help me submit the request quickly without re-entering information IT already has	Help me get a timely, fair decision on my request	Help me get my connection set up correctly and on time	Help me know the outcome without having to follow up
Positive Moments <i>What works well</i>	Clear starting point — no confusion about where to go	Guided form; existing-ID field appears only when relevant	Automated routing means no manual chasing of approvers	Fulfilment team works from complete, accurate data	Automatic email removes the need to check in manually

Negative Moments (Before) <i>Prior pain points this project addresses</i>	Previously, employees didn't know where to raise network requests	Previously, request details were scattered across emails and calls	Previously, approvals were delayed with no visibility into status	Previously, missing or inconsistent details caused fulfilment delays	Previously, requesters had to call IT to learn the outcome
Areas of Opportunity <i>Ideas for what's next</i>	Add a short portal banner pointing employees to “Network Requests”	Extend the variable set to cover more request types in future	Add SLA timers on the approval step for further visibility	Integrate with network provisioning tools (e.g. Cisco DNA Center) for auto-fulfilment	Add a short satisfaction survey after closure for continuous improvement
